## Alerting Abstract JP A

**NOVELTY** - The display device has anode layers (2b,2g), organic light emitting layer (6) and cathode layer (4), which are sequentially laminated on a glass substrate (1). A spacer (7) comprising a dehydrating or deoxidation agent is formed at the peripheral portion of the surface where the anode layer is formed.

**DESCRIPTION** - INDEPENDENT CLAIMS are also included for the following:

manufacturing method of organic electroluminescent display device; and  
electronic device.

**USE** - For electronic device (claimed) such as personal computer, mobile telephone, digital still camera, videotape recorder, television, view finder, car navigation apparatus, pager, electronic notebook, calculator, word processor, workstation, video telephone, point-of-sale (POS) terminal and touch panel.

**ADVANTAGE** - The degradation of the organic electroluminescent panel is prevented for a longer period of time.

**DESCRIPTION OF DRAWINGS** - The figure shows a cross- sectional view of the organic electroluminescent panel structure.

1 glass substrate

2b,2g anode layers

4 cathode layer

6 organic light emitting layer

7 spacer
